

Facts about Covid-19

- * The virus is not a living organism, but a protein molecule (DNA) covered by a protective layer of lipids (fats) which, if absorbed by the cells of the ocular, nasal or mouth mucosa, changes their genetic code (mutation) and converts them into multiplier and attacker cells.
- * Since the virus is not a living organism but a protein molecule, it is not killed, but decays on its own. The disintegration time depends on the temperature, humidity and the type of material in which it is found.
- * The virus is very fragile; the only thing that protects it is a thin outer layer of fat. That's why any soap or detergent is the best remedy, because the foam **BREAKS DOWN THE GREASE** (that's why you have to rub so much: for at least 20 seconds or more, and make a lot of foam). By dissolving the fat layer, the protein molecule disperses and breaks down on its own.
- * **HEAT** melts the fat; then use water above 25 degrees to wash your hands, clothes and everything else. In addition, hot water produces more foam which makes it even more useful.
- * Alcohol or any mixture with alcohol greater than 65% **DISSOLVES ANY FAT**, especially the external lipid layer of the virus.
- * Any mixture with 1 part of bleach and 5 parts of water directly dissolves the protein, breaks it down from the inside.
- * Hydrogen peroxide helps a lot after soap, alcohol and chlorine, because peroxide dissolves the proteins of the virus, but you have to use it pure and it hurts the skin.
- * **NO BACTERICIDES.** The virus is not a living organism like bacteria; one cannot kill with antibiotics what is not alive, but rapidly disintegrate its structure with all that has been said.
- * **NEVER** shake used or unused clothing, sheets or clothing. While it is glued on a porous surface, it is very inert and disintegrates only between 3 hours (fabric and porous), 4 hours (copper, because it is naturally antiseptic; and wood, because it removes all moisture and does not let it detach and disintegrates), 24 hours (cardboard), 42 hours (metal) and 72 hours

(plastic). But if you shake it or use a duster, the virus molecules float in the air for up to 3 hours and can settle in your nose.

* Viral molecules remain very stable in external or artificial cold like air conditioners in homes and cars. They also need moisture to remain stable and especially darkness. Therefore, dehumidified, dry, warm and bright environments will degrade it more quickly.

* Vinegar is **NOT** useful because it does not break the protective layer of fat.

* **NO ALCOHOL or VODKA.** The strongest vodka is 40% alcohol and you need 65%.

* **USE MOUTHWASH IF YOU NEED IT!** It's 65% alcohol.

* The more space is limited, the higher the concentration of the virus. More open or naturally ventilated, less.

* **ALWAYS REMEMBER** you have to wash your hands before and after touching the mucous membrane, food, locks, knobs, switches, remote control, cell phone, watches, computers, desks, TV, etc. and when using the bathroom.

* You must **HUMIDIFY DRY HANDS**, for example wash them a lot, because molecules can hide in micro wrinkles or cuts. The denser the moisturiser, the better.

* Also keep your **NAILS SHORT** so that the virus doesn't hide there.

PHYSICAL DISTANCING IS KEY TO FLATENING THE CURVE
